## **ABSTRACT OF THE DISCLOSURE**

The present invention discloses a conductive composition, comprising: (a) at least one polymer; (b) at least one conductive filler, dispersed in the polymer; and (c) a coupling agent, applied to improved the adhesion between the polymer and the conductive filler and having a structure as follows:

$$(R^{1} O)_{m}M - (OR^{2})_{a}$$

wherein M represents a metal atom or silicon; R<sup>1</sup> and R<sup>2</sup> represent a substituted or unsubstituted alkyl group; X represents sulfur or phosphorous; and a, m and n represent integers of 0 to 2.
